Package Diagram

UML (UNIFIED MODELING LANGUAGE)

How Package Diagram Looks Like?

Package Diagram

What is Package Diagram?

- ❑ Package diagrams are UML structural diagrams.
- ❑ Package diagram shows the arrangement and organization of model elements in middle to large scale project.

What is Package Diagram?

□ They are used to show the organization and arrangement of various model

elements in the form of packages.

▪ *Such as diagrams, documents, classes, or even other packages.*

Benefits of Package Diagram

- ❑ A well-designed package diagram provides numerous benefits to those looking to create a visualization of their UML system or project.
- ❑ They provide a clear view of the hierarchical structure of the various UML elements within a given system.
- ❑ These diagrams can simplify complex class diagrams into well-ordered visuals.

Benefits of Package Diagram

- ❑ They offer valuable high-level visibility into large-scale projects and systems.
- ❑ Package diagrams can be used to visually clarify a wide variety of projects and systems.
- ❑ These visuals can be easily updated as systems and projects evolve.

Package Diagram Basic Symbols

❑ **Symbol Name:** Package

❑ **Description:** Groups common elements based on data, behavior, or user interaction

Package Diagram Basic Symbols

❑ **Symbol Name:** Dependency

❑ **Description:** Depicts the relationship between one element (package, named element, etc.) and another

Package Diagram Basic Symbols

❑ Symbol Name: Dependency

❑ There are two main types of dependencies:

1. **Access:** Indicates that one package requires assistance from the functions of another package.

Example:

Package Diagram Basic Symbols

❑ Symbol Name: Dependency

❑ There are two main types of dependencies:

2. **Import:** Indicates that functionality has been imported from one package to another.

Example:

Example 1: Order Processing System

HOW TO DRAW PACKAGE DIAGRAM

Example 1: Order Processing System

□ Step 1: Identify the packages

Example 1: Order Processing System

❑ Step 1: Identify the packages

- ❑ **UI Framework:** is the set of classes and interfaces.
- ❑ **Order Processing:** picking, packing, and delivery of the packed items.
- ❑ **Track Order:** it has to talk with other module to know about the order details
- ❑ **Shipping:** to know shipping information, "Shipping" can import "Track Order".

Example 1: Order Processing System

❑ Step 2: Identify the dependencies in the System

- ❑ Track order should get order details from "Order Processing" and "Order Processing" has to know the tracking info given by the customer.
- ❑ Two modules are accessing each other which suffices <<access>> dual dependency.

Example 1: Order Processing System

❑ Step 2: Identify the dependencies in the System

- ❑ To know shipping information, "Shipping" can import "Track Order" to make the navigation easier.

Example 1: Order Processing System

❑ Step 2: Identify the dependencies in the System

- ❑ Finally, Track Order dependency to UI Framework is also mapped which completes our Package Diagram for Order Processing subsystem.

Example 2: Online Shopping
